

# **SETlinc BRIEF**

## **What We Do**

SETlinc provides expertise and resources to help “those serving Him” communicate using websites. We provide information about Knowledge Management, website design, and Open Source software. SETlinc offers personal assistance at no cost to missionaries and churches.

From knowledge management to usability to graphic design, material relating to website design can be found at SETlinc.com.

Open Source software provides extremely useful tools built by volunteers, available at no cost. A free resource, Open Source software can be found all across the internet. Links to a selection of particularly useful tools are available at SETlinc.com.

From the GIMP, a full featured graphics software compatible with and much like Adobe Photoshop, to OpenOffice, a full featured productivity suite compatible with and much like Microsoft Office. Sourceforge is a community website where Open Source developers work on various software projects, and is a great place to start when looking for an Open Source software application.

When preparing material for a website, it is often helpful to talk with those who will be doing the communicating, both authors and audience. The technology is secondary to the information being communicated. Graph paper is available for download at setlinc.com, and is a great first step tool for sketching information flow, and the types of content that will be communicated.
